Usability research
Quantitative & qualitative summary

Custom apparel store | Participant outcomes, behavioral findings, and priorities

De'Andre Perry | UX Designer & Researcher
Study plan date: August 7, 2026 | Revision: November 7, 2026

Study: 10 prior donors | 5 mobile / 5 desktop | Moderated think-aloud usability sessions | Four tasks ending before payment. Session protocol: 35–45 minutes.

Research question

Could SBF supporters find apparel, personalize an item, locate delivery information, and review their order independently? The quantitative results describe task outcomes; the qualitative observations help explain where the experience broke down.

01 / Quantitative results

Task	Independent	Not independent	Completion rate
T1 / Find apparel	8 of 10	2 of 10	80%
T2 / Personalize an item	6 of 10	4 of 10	60%
T3 / Find delivery information	5 of 10	5 of 10	50%
T4 / Review the order	7 of 10	3 of 10	70%

Independent = completed without directional moderator assistance. Not independent = did not complete independently; the summary does not split assisted completion from incomplete tasks. Every task uses a denominator of 10 participants. Percentages describe this study sample.

Across all four tasks

3 of 10 participants (30%) completed every task independently: P03, P08, and P10. The other 7 participants (70%) had at least one task they did not complete independently. This is a usability outcome, not a purchase conversion rate.

What the numbers show

Finding delivery information had the lowest independent completion rate (50%), followed by personalization (60%). Finding apparel had the highest rate (80%). These results support examining delivery and customization first, alongside order-review barriers.

02 / Qualitative findings

The notes below are behavioral summaries, not verbatim quotations. Participant references link each theme to the study's reported observations. The number of selected notes is not the total number of participants who experienced a theme.

F01 / Delivery information was hard to locate

OBSERVATIONS: P01 searched the footer for a delivery estimate. P05 looked for the fulfillment policy before proceeding. P07 did not locate delivery reassurance.

INTERPRETATION: Delivery expectations were not sufficiently visible at the point of purchase consideration. PROPOSED RESPONSE: Surface production and shipping estimates on the product page, with a clear link to applicable details.

F02 / Personalization lacked clear confirmation

OBSERVATIONS: P02 rechecked the name field to see whether it had saved. P06 could not tell whether the number had been applied. P09 was unsure whether customization was confirmed.

INTERPRETATION: The saved state was not clear enough for these participants to verify their choices. PROPOSED RESPONSE: Confirm updates immediately and keep the selected name or number visible in the order summary.

F03 / Apparel labels did not match expectations

OBSERVATIONS: P04 missed the apparel category. P07 expected shirts under a different category.

INTERPRETATION: Category wording or placement did not match how these shoppers looked for apparel. PROPOSED RESPONSE: Test clearer collection labels and navigation placement using the same discovery task.

F04 / Final review created uncertainty

OBSERVATIONS: P04 exited before reaching order review. P07 stopped at checkout. P09 hesitated when the total changed.

INTERPRETATION: The observations identify review-stage barriers, but do not establish the same cause for every participant. PROPOSED RESPONSE: Present item selections, personalization, known costs, and fulfillment details together before payment; explain costs that depend on later information.

What worked

P03 found an item through a collection and confirmed choices in the summary. P08 used category filters and followed the intended checkout path. P10 checked the total and continued through review. These successful paths suggest useful patterns to preserve and investigate further.

03 / Participant outcomes and decisions

ID	Device	T1	T2	T3	T4
P01	Desktop	Yes	Yes	No	Yes
P02	Mobile	Yes	No	No	Yes
P03	Desktop	Yes	Yes	Yes	Yes
P04	Mobile	No	No	No	No
P05	Mobile	Yes	Yes	No	Yes
P06	Desktop	Yes	No	Yes	Yes
P07	Mobile	No	Yes	No	No
P08	Desktop	Yes	Yes	Yes	Yes
P09	Mobile	Yes	No	Yes	No
P10	Desktop	Yes	Yes	Yes	Yes

Yes = completed independently. No = not completed independently. T1: find apparel; T2: personalize; T3: delivery; T4: order review. The task totals are 8, 6, 5, and 7 independent completions respectively. Three rows contain Yes for every task.

Connecting the numbers and observations

Delivery has the lowest completion count, and the associated observations show participants searching for timing information. Personalization has the next-lowest completion count, while notes show repeated checking and uncertainty about saved choices. Order review and discovery also warrant changes. Task noncompletion counts do not prove that every affected participant encountered the specific issue shown in the selected notes.

Recommended order of work

1. Make delivery information easier to find.
2. Confirm saved personalization and preserve it in the summary.
3. Clarify selections and costs at order review.
4. Test clearer apparel labels and placement.

Follow-up and interpretation

Retest implemented changes with 10 new comparable prior donors, split 5 mobile / 5 desktop, using the same tasks and success criteria. The proposed goal is at least 9/10 independent completions per task. Keep first-time-supporter and focused accessibility testing separate. Improvements, implementation status, and business effects require their own follow-up records.
